Xila

BRAND / TEMPLATE SPECIMEN

A shared language for Xila.

Document template and authoring guide

A practical starting point for technical notes, proposals and project reports. Replace this example with your own content.

Xila project

9 November 2026 / Example 1.0

1 Start with the decision

Write the point of the document first. Explain who it helps, what changes and which evidence supports the recommendation. Keep headings short and use a concrete title.

This specimen demonstrates Xila's document hierarchy: Montserrat Regular for text, SemiBold for headings and Bold for emphasis. The outlined logo remains an artwork asset; it is never recreated as text.

> **One identity, several formats**
>
> Use this template for reports and technical notes. Use the companion 16:9 template when the material will be presented on screen.

1.1 Structure a useful document

- Give the reader enough context to understand the decision.
- State the constraints before describing the implementation.
- Separate verified results from planned work.
- End with the next action and the person responsible.

1.2 Keep the evidence readable

Element	Purpose
Heading	Helps the reader find the next idea.
Table	Makes genuinely parallel information easier to compare.
Callout	Highlights one decision or constraint.

2 Make the template yours

2.1 Supply document metadata

The template accepts a title, subtitle, category, authors, date, version, summary and language. Omit optional values rather than filling the page with placeholder labels.

```
#import "../document.typ": xila-document
#show: xila-document.with(
  title: "Your document title",
  authors: ("Your name",),
  category: "Technical note",
)
```

2.2 Use local, reproducible assets

The palette and typography settings come from `source/identity.json`. The templates use the repository's outlined SVG logos and local Montserrat font files. Compilation requires no remote package registry or font service.

> **Before sharing**
>
> Check page breaks, links, table wrapping and the distinction between measured results and assumptions. Update the title and author metadata as well as the visible cover.

2.3 Credit the work

The Xila Monogram logo was designed by Martin Legand. Montserrat is distributed under the SIL Open Font License; preserve `fonts/OFL-Montserrat.txt` when redistributing the font files. See the repository's `NOTICE` for artwork attribution.

This is a template specimen, not a product specification or a claim about supported hardware.
